Simple Use Case (AutoComplete)

Markup:

Script:

Instantiates a new AutoComplete object, myAutoComp, which queries an existing DataSource myDataSource.

Constructor (AutoComplete)

```
YAHOO.widget.AutoComplete(str | el ref input field, str |
el ref suggestion container, obj DataSource instance[,
obj configuration object]);
```

Arguments:

- (1) **HTML element (string or object):** Text input or textarea element.
- (2) HTML element (string or object): Suggestion container.
- (3) **DataSource instance (obj):** An instantiated DataSource object; see below for DataSource types and constructor syntax.
- (4) **Configuration object (object):** An optional object literal defines property values of an AutoComplete instance.

Constructors (DataSource Classes)

```
YAHOO.widget.DS_JSArray(arr js array[, obj configuration
  object]);
```

- (1) JS Array (array): A JavaScript array of strings.
- (2) Configuration object (object): An optional object literal defines property values of a DataSource instance.

- (1) JS Function (fn): A JavaScript function which returns an array of strings.
- (2) Configuration object (object): See above.

- (1) **URI:** URI to the script location that will return data.
- (2) Schema (array): Schema description of server response data.
- (3) Configuration object (object): See above.

```
YAHOO.widget.DS_XHR(sr script uri, array schema[, obj
      configuration object]);
```

- (1) **Script URI (string):** Server URI (local domains only use a proxy for remote domains).
- (2) Schema (array): Schema description of server response data.
- (3) Configuration object (object): See above.

Interesting Moments (AutoComplete)	
Event	Arguments (passed via args array)
textboxFocusEvent/ textboxBlurEvent	[0] AC instance
textboxKeyEvent	[0] AC instance; [1] keycode int
dataRequestEvent/ dataErrorEvent	[0] AC instance; [1] query string
dataReturnEvent	[0] AC instance; [1] query string; [2] results array
containerExpandEvent/ containerCollapseEvent	[0] AC instance
itemArrowToEvent/ itemArrowFromEvent	[0] AC instance; [1] element
itemMouseOverEvent/ itemMouseOutEvent	[0] AC instance; [1] element
itemSelectEvent	[0] AC instance; [1] element; [2] item data object or array
selectionEnforceEvent	[0] AC instance
unmatchedItemSelectEvent	[0] AC instance; [1] user selected string
typeAheadEvent	[0] AC instance; [1] query string; [2] prefill string
Subscribe to AutoComplete Custom Events on your AutoComplete instance:	

Simple Use Case (DataSource)

```
var myDataSource=new YAHOO.widget.DS_JSArray(["a","b"]);
```

myAC.containerExpandEvent.subscribe(myFn[, myObj, bScope]);

Instantiates a new DataSource object, myDataSource, which is an array of strings that gueries can be matched against.

Custom Formatting (AutoComplete)

The formatResult function gets passed (1) an array that holds result data and (2) the original query string. Override this function to return custom markup to populate each <|i> element in the container.

```
myAC.formatResult = function(aResultItem, sQuery) {
   var sKey = aResultItem[0]; //the query match key
   // Additional data mapped by schema
   var attribute1 = aResultItem[1];
   var attribute2 = aResultItem[2];
   return (sKey + ": " + attribute1); }
```

Dependencies

AutoComplete requires the YAHOO Global Object, Dom, and Event; Connection Manager (for DS_XHR datasources), Animation (for animated opening of the suggestion container), Get and JSON (for DS_ScriptNode datasources) are optional.

YAHOO.widget. AutoComplete Properties:

```
animVert (b)
animHoriz (b)
animSpeed (int)
